FEATURE SUMMARY

- Chamber volume from 120 to 310 liters
- Working pressure meets ASME and PED requirements
- Temperature range 105 °C (221 °F) to 138 °C (280 °F)
- 18 kW / 27 kW integral steam generator or external steam source
- User friendly control system with touch screen display
- 30 Programs: 8 factory set programs, 2 test programs, 20 programmable cycle programs
- Built-in printer
- Ethernet connection port for PC access via network
- USB port to download cycle data to memory device
- Pressure gauges on front panel
- 316L stainless steel chamber and door
- Chamber has a mirror-like finish
- Stainless steel piping
- Conforms to Medical Device Directive 93/42 EEC and PED 97/23 EC, FDA Clearance
- Conforms to standards: ASME, AAMI/ANSI-ST8, EN 285, UL
- Optional configurations available

PRODUCT DESCRIPTION

This autoclave series is designed to cover a large field of applications for hospitals, CSSD and medical centers.

The autoclave series has a chamber volume range from 120 liters to 310 liters.

The autoclave operates with saturated steam as the sterilizing agent with a temperature range from 105 °C (221 °F) to 138 °C (280 °F) and a working pressure that meets ASME and PED requirements. The autoclave is equipped with an 18kW and 27kW integral electrical steam generator which supplies the necessary steam for the sterilization process. The sterilizer may also be steam fed from an external steam source.

APPLICATIONS

Central Sterilizing Supply Department (CSSD)
Operating Theater
Out Patient Clinic

Information furnished by Tuttnauer is believed to be accurate and reliable. However, no responsibility is assumed by Tuttnauer for its use.

This specification is subject to change without notice.
TECHNICAL SPECIFICATION
44 and 55 Compact Sterilizer Series

PRODUCT SPECIFICATION

CHAMBER VOLUME & SIZE

DOOR SELECTION
- Single door
- Double door (pass through)
- Manual right hinged
- Manual left hinged
- Automatic vertical sliding (door on left, control on right)
- Automatic vertical sliding (door on right, control on left)

All automatic doors have a robust hydraulic mechanism for operating doors.

SERVICE ACCESS
From loading side and left or right side.

INSTALLATION SELECTIONS
- Installed in a wall [Single Door]
- Cabinet enclosure [Single Door]
- Cabinet enclosure through one wall [Double Door]
- Installed through two walls [Double Door]

ELECTRICAL COMPONENTS
The following parts are located in the electric boxes:
- The Solid State Relays for the command of the vacuum pump, and the water pump.
- The Circuit Breakers for protection of all power circuits.
- The power supplies for powering of electronic circuitry and solenoid valves.
- An overload switch is used to protect the device from high overload currents.
- The connection elements (sockets, plugs, etc) and components have a degree of protection conforming to the IPX4 protection level and conform to the IEC60529 standard.

VOLTAGE SUPPLY
Three phase or one phase electricity supply is available.

Voltage:
- 415V 3-Phase with Neutral
- 380V / 400V 3-Phase with Neutral
- 230V 3-Phase with Neutral
- 208V 3-Phase with or without Neutral
- 220V / 230V 1-Phase (not 55120 model)
- 110V / 115V 1-Phase *

* For 18kW with building steam supply (optional vacuum by ejector)
Frequency: 50 Hz or 60 Hz

Customized electrical specifications are available (additional cost).

LANGUAGE
The operator display is available in 26 languages including:
- English, Spanish, German, Dutch, Russian, Chinese, Arabic.

STANDARDS AND CODES
Tuttnauer products meet the following provisions and standards:

Europe:
EN285: 2006+A2:2010 for Large Autoclaves

USA:
ANSI/AAMI - ST 8: 2008 – Hospital Sterilizers

Directives & Guidelines:
97/23/EC - Pressure Equipment Directive
2002/95/EC - RoHS Directives
2004/108/EC - Electromagnetic compatibility
2006/95/EC - Electrical equipment
2006/42/EC - Machinery Directive

Safety and EMC Standards:
EN 61010-1: 2001
EN 61010-2-040: 2005
EN 61326-1: 2006
EMC Directive 89/336
EN 60529:1991 - Degrees of Enclosure Protection (IPX4)

Pressure Vessel and Steam Generator Construction Standards:
ASME Code, Section VIII, Division 1, unfired pressure vessels
ASME Code, Section I, for boilers

Good Practice Standards:
ISO 17665-1: 2006
ANSI/AAMI – ST 8: 2008

Quality System Standards:
ISO 9001:2008 (Quality Systems)
ISO 13485:2003 (Quality Systems for Medical Devices)
Compliance with 21 CFR 820
**TECHNICAL SPECIFICATION**

44 and 55 Compact Sterilizer Series

**CHAMBER CONSTRUCTION**

**Materials**
The sterilizer chamber is constructed from solid, high quality materials. Chamber and door thickness is no less than 5 mm.

Standard Configuration Materials:

- Chamber + Door: 316L stainless steel
- Jacket: 304L stainless steel

Optional Materials (Stainless Steel):

- Chamber + Door: 316Ti
- Jacket: 316L or 316Ti

**Chamber Design**
The chamber is **fully jacketed**. A stainless steel mesh strainer protects the drain port from blockage by debris. The chamber is mounted on a steel framework which is height adjustable.

**Door Gasket**
- Manual hinged door gasket: a silicone gasket is permanently fixed in the door.
- Automatic sliding door gasket: a silicone gasket is fixed in a groove in the door frame and the gasket is sealed against the door by means of steam pressure.

**Surface Treatment**
A passivation layer is applied to the internal surface through an electro-chemical treatment which results in a smooth and shiny stainless steel. The resultant surface is polished to less than 0.8 µm which is highly protected against corrosion. The internal corners are rounded to aid cleaning.

**Chamber Heating**
The fully jacketed chamber is pre-heated by steam in the jacket.

**Insulation**
The sterilizer jacket and door are completely insulated with a 1” chloride free glass wool thereby keeping the autoclave cool on the outside. Customized thicker insulation is optional. The insulation is completely enclosed within a stainless steel cover.

The insulation reduces the energy consumption by keeping the heat inside the jacket and chamber.

**SAFETY FEATURES**

**Door Safety Systems:**
- A pneumatic safety component (pressure switch) is installed in the autoclave which prevents opening of the doors until pressure in the chamber reaches room pressure.
- Door chamber cannot be opened when chamber is pressurized
- Steam is not allowed into the chamber when the door is open
- A cycle cannot start if the door is open or not properly locked
- The sliding door movement will stop immediately if an object is detected in front of the closing door
- Double door safety is implemented through interlocks which prevent both doors from being opened simultaneously

**Safety Valves:** Both chamber and jacket are equipped with pressure relief safety valves. If the pressure exceeds the allowed limit then the safety valves will discharge.

**Built-in Steam Generator Safety:** A water level control system maintains a constant water level that ensures safe operation of the heaters. Furthermore, a sensor ensures that the heater does not operate without a minimum water intake.

**Emergency Shut-Off:** Easily accessible emergency switches for immediate cycle shut-off.

**Double Independent Monitoring:** The combined digital and mechanical monitoring systems provide a cross-reference and guarantee accurate results. The operator has two means of monitoring temperature and pressure.

**WATER RING VACUUM PUMP**
The vacuum pump effectively removes more than 99% air from the chamber. The pump is mounted on a damping mechanism to minimize vibration.

During vacuum action the flow path of the fluids is through the condenser (heat exchanger) and the vacuum pump/ejector to drain. This protects the vacuum system from excessive temperatures.

**PIPES & COMPONENTS**
The piping system of the autoclave consists of air-operated ball valves, which control the condensate and steam flow in and out of the chamber, operates the vacuum, and the air inlet valve.

Standard configuration:
- Piping and fittings: 304 threaded stainless steel
- Components*: Brass

Optional configuration (stainless steel):
- Primary piping & fittings **: 316 + triclamp fittings
- Primary components: 316 triclamps or 316 threaded

* Components – Manual valve, non-return valve, pressure regulator, pneumatic valves, steam trap, etc.

** Primary piping system that connects to the chamber up to and including the first valve.

**PRESSURE GAUGES**
The single door configuration has four pressure gauges that indicate the pressure in the chamber, jacket, door gasket, and the steam generator.

These pressure gauges are located on the autoclave’s front panel (loading side).

The double door configuration has two additional pressure gauges on the unloading side that indicate the pressure in the chamber and the pressure in the gasket of the second door.

**VALIDATION PORTS**
The chamber is provided with two 1” threaded connections for optional vacuum/pressure gauges and test sensors. The Validation Ports are each found on the right and left side of the sterilizer from the control side.
AIR FILTER
A disposable microbiological air filter is provided to filter all air entering the sterilizer chamber. The air is used to equalize the chamber pressure to atmospheric pressure at the end of the sterilization cycle.

The filter is rated for a particle size of 0.2 µm.

STEAM SUPPLY
The autoclave is supplied with either a steam generator or an option to connect to building steam supply. A combined option of steam generator and building steam supply is also available.

Additional specialized steam supply configurations are listed in the Special Options and Accessories section below.

Built-in Steam Generator: supplies steam for the sterilization process. The stainless steel steam generator is an electrically heated type generator equipped with immersion heaters, divided in three-phases. The electrical system of the steam generator is located in a separate electric box.

Water to the steam generator is supplied by a single-phase pump, from a water reservoir, which is connected to a source of mineral-free water.

STEAM GENERATOR WATER QUALITY
Various water systems can be used to supply mineral-free water to the steam generator such as Reverse Osmosis (RO), distilled water, etc. Water supplied to the steam generator should be in compliance with the EN 285 standard which includes the following hardness and conductivity requirements:
- Hardness < 0.1 mmol/l
- Conductivity < 50 µS/cm
- Maximum consumption: 12 liters per standard load cycle

Note: Soft water should not be used since its use may result in corrosion of the steam generator and chamber.

VACUUM SYSTEM AND DRAIN COOLING WATER QUALITY
City tap water supply:
- Hardness between 0.7 and 2 mmol/l
- The tap water pressure should be in the range of 3 – 5 bar (40 - 72 psi)
- Recommended temperature: 15°C
- Consumption: 160 liters per cycle average

CONTROL SYSTEM (ALLEN-BRADLEY)
The controls system is based on the Allen Bradley MicroLogix 1400 PLC platform, and controls and monitors the physical parameters of the sterilization process, and performs the operation sequence of the machine, according to the selected program, and features:

- Data acquisition from 10 digital inputs: four PT100 sensors, four 4-20mA analog inputs, and two 0–10V analog inputs
- Digital inputs and outputs for sterilizer control
- Analog inputs from multiple temperature and pressure
- Measures chamber pressure, jacket pressure, steam generator pressure, door gasket pressure, and reference temperature
- Communication via a serial port or an Ethernet 10/100 communication port (on some configurations)
- Analogue sensor calibration
- FFlash mode
- FLASH memory and real-time clock backup store cycle data for at least 5 years even if there is a power failure

The system includes an additional memory device which contains: the updated software, offset and gains, and in the case of software or control error will reload the software automatically.

The control system controls all system functions, monitors system operations, both visually and audibly alerts the operator of cycle malfunctions and, on demand, provides visual indication of the chamber temperature and pressure.

TEMPERATURE AND PRESSURE SENSORS
The temperature and pressure measuring circuits are both linear and designed with components having a high precision. The PT100 sensors conform to Class A of the IEC751 standard.

When the exhaust temperature increases above 40°C (measured by a PT100 sensor at the exhaust drain) then tap water is mixed with the exhaust to drain.

The control system allows for the calibration of temperature and pressure to be performed digitally.

Each sensor circuit is calibrated with individual constants to correct the deviation in manufacturing and aging.

The system uses FLASH memory in which the offset and gain data of the sensors are stored. This data may be entered into the system, through programming or through the autoclaves touch screen control panel.
CONTROL PANEL
Control and Monitoring

The control system is operated via an easy to use full color touch screens (7” TFT LCD) found on both sides of the autoclave. One or both touch screens may be upgraded to 10” display.

The touch screen control panel supports multiple languages.

Twelve password access levels (0-12) are provided to control access/operation of the machine preventing unauthorized access. These access levels are customizable. Access control can be applied to the following functions operated from the control panel:
- running test cycles
- sensor calibration, service and maintenance
- cycle selection, cycle start, customizing cycle parameters
- door control
- testing inputs and outputs

With the standard factory configuration, calibration of the temperature circuits and calibration of the pressure circuits require an access code.

ALARMS

The autoclave uses both audible and visual alarm indicators. Automatic process checking and failure detection are provided by the control system. In the event of a failure during the sterilization cycle, the system enters an alarm phase which will safely end the process automatically. The range of alarms includes:
- Temperature & pressure sensor failure
- Phase time-outs
- Door(s) not properly closed
- Power failure
- No water in the water reservoir
- Optional utility alarms: no water / no steam / no air

CYCLE DOCUMENTATION - PRINTER

The autoclave is equipped with a printer which prints a detailed history of each cycle performed by the instrument. Various types of printers are listed in the Special Options and Accessories section towards the end of this document.

The printing format is 24 characters per line. The following information and set parameters are printed when the sterilization cycle begins:
- Autoclave serial number, load no., name
- Software version
- Real time
- Selected program
- Sterilization temperature, pressure, and time
- Dry time
- Alarms

Thereafter, the autoclave starts performing the sequence of operations of the cycle. The measured values of temperature and pressure are printed at fixed time intervals, according to various phases of the sterilization process: 4 minute time interval for vacuum, 1 minute time interval for sterilization, and the start and end time of the drying phase. All interval times can be user defined. Furthermore, the customer may request customized time intervals prior to order delivery.

The data is printed from the bottom up, beginning with the date and ending with “O.K.” for a complete cycle or “FAIL” for an aborted cycle.

OPTIONAL LOADING EQUIPMENT

Two Pull Out Trays

Stainless steel trays equipped with tracks for easy loading and unloading. The tracks are designed to prevent the trays from rolling over.

Loading Cart and Transfer Carriage

The loading cart rolls off the transfer carriage onto the chamber rails for easy handling of heavy loads.

The transfer carriage uses heavy duty revolving wheels (castors) to maximize mobility in limited space, and wheel brakes to prevent rolling. There is a lock to prevent the loading cart from sliding. The legs of the transfer carriage are adjustable to match the height of the loading cart with the tracks in the sterilizer chamber.

Both the loading cart and transfer carriage are made of durable AISI 304 or AISI 316 stainless steel.

See Special Options and Accessories section for more options.
STERILIZER DOCUMENTATION
A number of copies of the manuals are provided. Operator and service manuals are in selected language. Other manuals are in English. Manuals include electrical and piping diagram.

Furthermore, a CD is provided containing the following:
- Operators manual
- Technical manual
- Serial number for specific autoclave
- Factory test report prior to shipping
- Optional - technical specifications for component, etc.

MAINTENANCE / SERVICE PLAN
A global network of skilled service specialists can provide periodic inspections and adjustments to help assure low-cost peak performance. A detailed service and maintenance plan is included in the operator manual.

PACKAGING FOR SHIPMENT
The sterilizer is packed in a wooden crate for shipping/transportation.

WARRANTY
Tuttnauer warrants that each device is carefully tested, inspected and that it leaves the factory in proper working condition.

Tuttnauer certifies that the device is guaranteed to be free from defects in material and workmanship, for one year from installation date but not more than 18 months from shipping date, against faulty components and assembly. Extended warranty periods are optional.

The warranty does not include and does not replace routine treatment and preventive maintenance to be performed according to "Preventive and Periodical Maintenance" instructions mentioned in the device's accompanying manual.

The user must ensure that all utilities used, including the water, meet all the specifications mentioned in the operator manual.

The user is subject to the full warranty statement found in the documentation delivered with the equipment.
UTILITY DATA / REQUIREMENTS

External Steam Source
1. 97 – 100 % dry saturated steam
2a. Steam rate 46 kg/h for 6690, 66120, and 6671130 models
2b. Steam rate 80 kg/h for 6671162 Model
3. Protected by certified safety valve - max. 2.8 bar
4. Final steam pipe to the autoclave at least pipe 1" diameter
5. Install a shut-off valve at end of steam pipe

Electrical
With generator (all models)
- 3-Phase, 208 / 220 / 230 / 380 / 400 / 415 Volt, with or without neutral, 18 kW
- For autoclave model 55120: 3-Phase, 208 / 220 / 230 / 380 / 400 / 415 Volt, with or without neutral, 27 kW

Without generator (all models)
Note: must have building steam supply (optional vaccum by ejector)
- 3-Phase, 208 / 220 / 230 / 380 / 400 / 415 Volt, with or without neutral, not less than 10 A
- 1-Phase, 110 / 115 / 220 / 230 Volt, with neutral, not less than 10 A, (optional vacuum by ejector) (not for 55120 model)
- 1-Phase (only 4472 and 4480 Models), 220 / 230 Volt, with neutral, not less than 10 A, vacuum by V6 vacuum pump

Additional customizable electrical specifications are available.

Drainage (Sewage)
1. At least 2” sewage pipe.
2. The sewage shall be able to withstand continuous temperature of 80 °C and for short time periods at 100 °C.
3. Each autoclave will have a separate sewage line connected to a vertical vent pipe. Vertical pitch is 1000 mm.

Note: Local national regulations may require that the drain be tapped and vented, and not connected to other drains which may cause back pressure or obstruct flow. An air break may also be necessary.

Mineral-Free Feed Water for Steam Generator
1. Water intended for the steam generator must have a water quality in accordance with EN 285:2006+A2:2009
2. Install 1/2" pipe with a shut-off valve at its end
3. Regulations may require a Back-Flow protection device
4a. Supply: 25 l/h for sterilizers using 18 kW steam generators
4b. Supply: 37 l/h for sterilizers using 27 kW steam generators

Tap Water
1. Intended for vacuum pump and cooling
2. Install 1/2" pipe with shut-off valve at its end
3. Supply pressure 2 – 5 bar at approximately 15 °C temperature.
4. Local regulations may require a Back-Flow protection device
5. Hardness (free of alkaline earth ions) should be between 0.7 mmol/l and 2.0 mmol/l
6. Supply: approximately 17 l/min

Compressed Air
1. At least 3/8” hose to supply the compressed air
2. The compressed air supply line coming from the building must have a shut-off valve
3. Pressure: 6 to 8 bar, free from liquid water, filtered to 25 µm, free from oil droplets greater than 2 µm

Ambient Temperature
Plant room temperature should be in the range from 5 to 40 °C and 85% RH (relative humidity).

Floor
The unit mass shall be considered no less than 10000 N/m² according to the DIN 58949-7:2004 standard.

Ventilation
10 air replacements per hour

</tr>
</tbody>
</table>

**Notes:**
Residual air is displaced by 4 vacuum pulses (down to 25 kPa) and 3 steam pulses up to 160 kPa. When the pressure reaches atmospheric pressure, the vacuum pump is activated until the pressure drops to 25 kPa.

### Program 8 – Prion

# TECHNICAL SPECIFICATION

## 44 and 55 Compact Sterilizer Series

### Program 9 - Bowie & Dick Test

**Efficiency test of air removal from within the chamber**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Units</th>
<th>Range</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Sterilization Temperature</td>
<td>ºC</td>
<td>-</td>
<td>134</td>
</tr>
<tr>
<td>2. Sterilization Time</td>
<td>min</td>
<td>-</td>
<td>3.5</td>
</tr>
<tr>
<td>3. Exhaust Mode</td>
<td></td>
<td>-</td>
<td>1 (fast)</td>
</tr>
<tr>
<td>4. Drying Time (Post-Vacuum)</td>
<td>min</td>
<td>-</td>
<td>2</td>
</tr>
</tbody>
</table>

**Notes:**
Residual air is displaced by 4 vacuum pulses (down to 25 kPa) and 3 steam pulses up to 160 kPa. Drying is performed during a "low-pressure" phase. When the pressure reaches atmospheric pressure the vacuum pump is activated until the pressure drops to 25 kPa. Only the number and type of vacuum pulses can be modified.

### Program 10 - Vacuum Test

**Air leakage test to chamber through door and other seals**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Units</th>
<th>Range</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Stabilizing Time</td>
<td>min</td>
<td>-</td>
<td>5</td>
</tr>
<tr>
<td>2. Test Time</td>
<td>min</td>
<td>-</td>
<td>10</td>
</tr>
</tbody>
</table>

**Notes:**
Chamber vacuum is brought to 10 kPa. Thereafter all valves and motors are closed for 5 minutes enabling pressure stabilization. The acceptable pressure change over the following 10 minutes is 1.3 kPa.
**TECHNICAL SPECIFICATION**

**44 and 55 Compact Sterilizer Series**

## SPECIAL OPTIONS AND ACCESSORIES

### ADVANCED CONTROL FEATURES

10” TFT (LCD) Touch Screen
- Upgrade from 7” to 10.4” touch screen.

R.P.C.R Software
- Software that is installed on a network connected PC, allows for downloading of cycle data from an autoclave connected to the same network. Software gives access to: cycle data graph, numeric cycle data, print-outs, measured values table, parameter table, and more.

Remote Automated Cycle Data Recording
- Automatic recording of cycle information to any PC on the same Ethernet network
- Convenient access to graphs and tables
- Generate PDF reports

### ADVANCED STEAM RELATED OPTIONS

Automatic Blow Down
- Automatic drainage can be accomplished through the use of a programmable timer.

Separate Connection to Jacket and Chamber
- Enables reaching sterilization at a faster rate and improved temperature control when working with liquids, especially with 105°C and less. This feature is vital for clean steam systems.

### ACCESSORIES

Air Compressor
- For operating the pneumatic valves and automatic door/s (must be ordered if there is no local source of compressed air).

Hotwell
- The hotwell heats water to about 80-90°C to remove non-condensable gases prior to being pumped to the steam generator or STS generator.

Bio Shield Frame
- The sterilizer is surrounded by a frame which serves as a preparation for a cross-contamination seal made of Neoprene sheet that is attached between the frame and the wall at site.

Water Recycling System
- This system recycles water necessary for the heat exchanger to cool down the steam exhaust from the chamber. The water saving system recycles the water and reuses it. Tuttnauer’s water saving system saves more than 50% of the tap water used.

### SPECIAL OPTIONS

#### 44 and 55 Compact Sterilizer Series

- **DPU 414**
  - The DPU-414 is a silent high-quality printer that prints characters and high-density graphics. The DPU-414 prints a detailed history of each cycle performed by the instrument.

#### ADVANCED STEAM RELATED OPTIONS

- **Automatic Restart and Shutdown**
  - Feature enables a preprogrammed restart and/or complete shutdown of utilities at cycle end or set time, closing all utility valves, returning chamber and jacket to ambient temperature.

- **Separate Connection to Jacket and Chamber**
  - Enables reaching sterilization at a faster rate and improved temperature control when working with liquids, especially with 105°C and less. This feature is vital for clean steam systems.

- **Air Compressor**
  - For operating the pneumatic valves and automatic door/s (must be ordered if there is no local source of compressed air).

- **Hotwell**
  - The hotwell heats water to about 80-90°C to remove non-condensable gases prior to being pumped to the steam generator or STS generator.

- **Bio Shield Frame**
  - The sterilizer is surrounded by a frame which serves as a preparation for a cross-contamination seal made of Neoprene sheet that is attached between the frame and the wall at site.

- **Water Recycling System**
  - This system recycles water necessary for the heat exchanger to cool down the steam exhaust from the chamber. The water saving system recycles the water and reuses it. Tuttnauer’s water saving system saves more than 50% of the tap water used.
